

Scaling Thermal Behavioral Ecology: DeepLabCut Machine Learning Models for Detecting Avian Thermoregulatory Responses

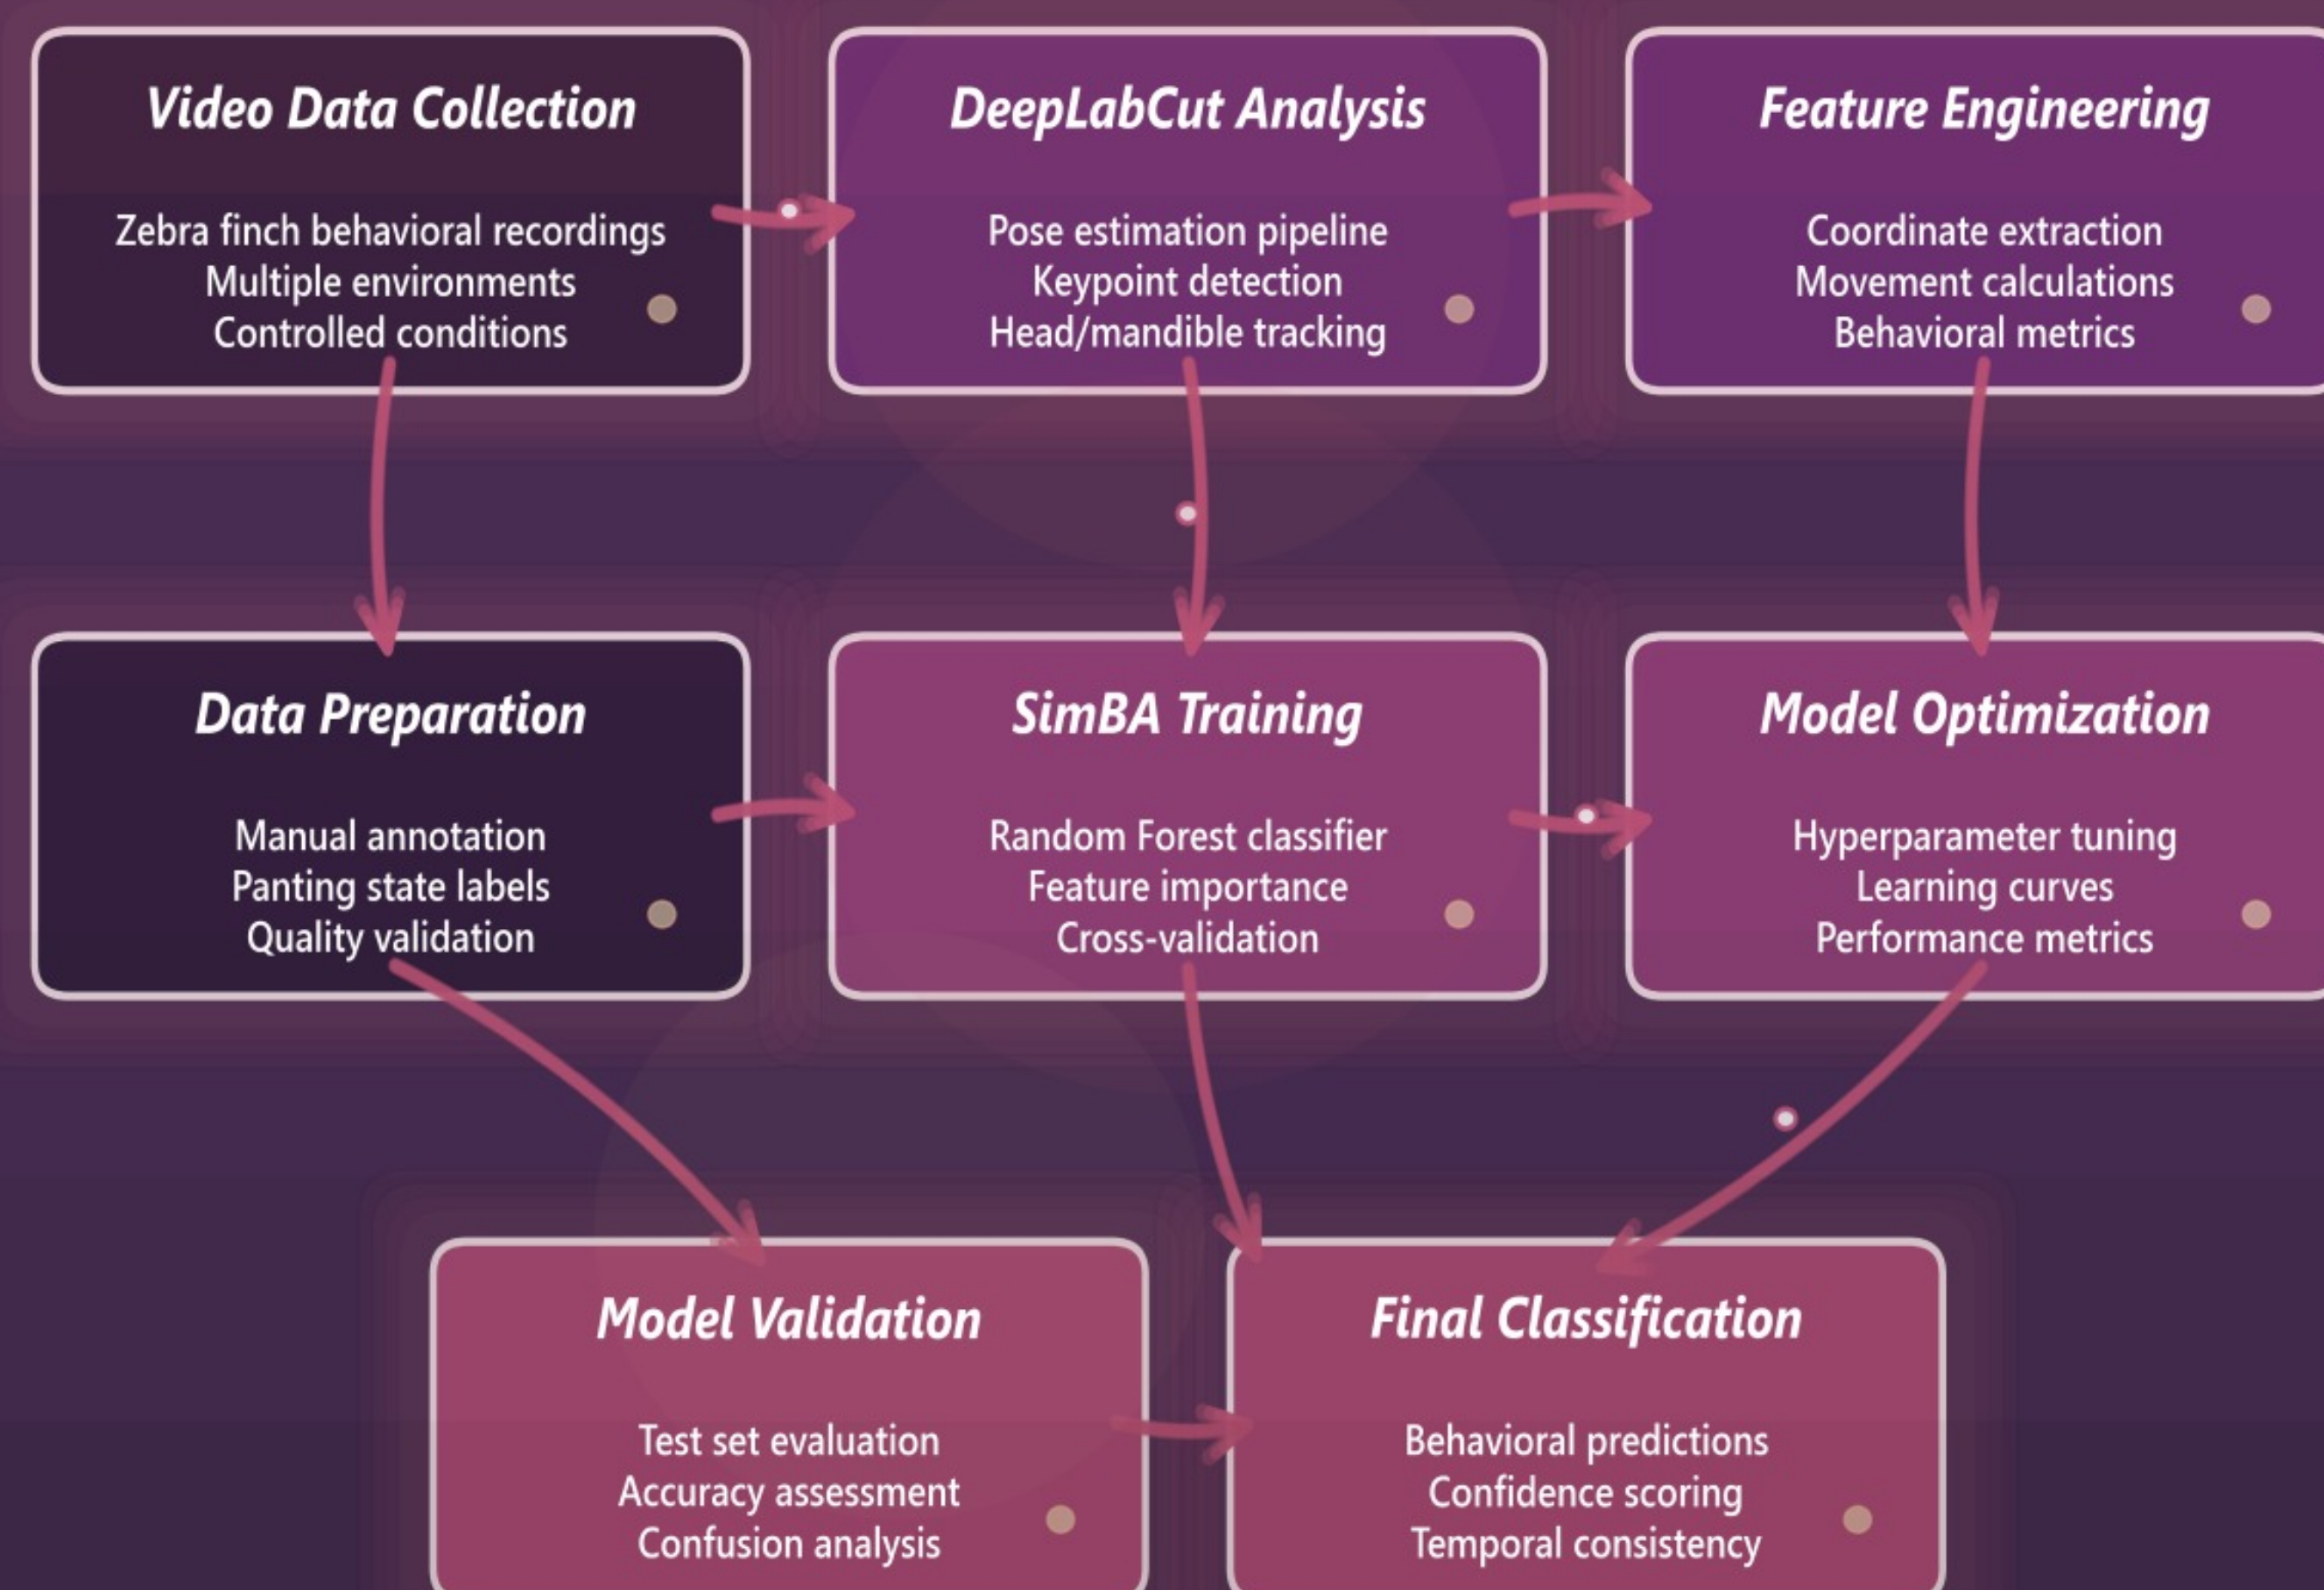

Shomari Taylor, Juan D. Zuluaga, Elizabeth P. Derryberry
University of Tennessee, Knoxville

The X is a part of the model I am not dead

Intro

Manual scoring restricts the scale of behavioral datasets and can introduce variation and inconsistency. **Machine learning** opens the possibility to analyze **large volumes** of footage with **consistent, reproducible accuracy**.

Methods

Results

- **Data:** 30 videos, 6-7k labeled frames

- **Keypoints:** head + upper/lower mandible

- **Training:** 100k iters; loss 0.040 0.006 (-84.7%)

- **p-cutoff error:** Test 7.76 px Train 3.78 px (gap \approx 4.0 px)

Future Directions

- **Cross-Species Expansion:** **Already trained on Zebra Finches & Least Terns**; adaptable to other birds.
- **More Behaviors:** Extend detection beyond panting/wing-spreading to other thermoregulatory behaviors available to wildbirds, and to non-thermoregulatory behaviors.
